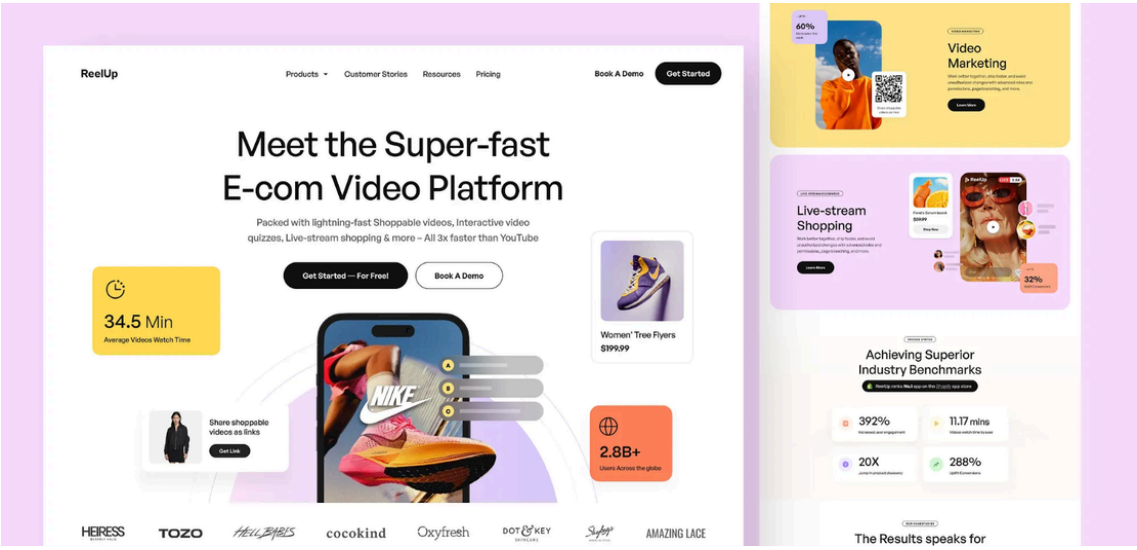
Animated Website Resources

1) Start frame



[PROJECT NAME] – First Frame Product Image

Create a high-quality product image using the uploaded photo of [PRODUCT NAME].
Place the product floating in the center of the frame with a slight, natural

tilt, similar to premium ads in the [INDUSTRY / NICHE – e.g. beverage, tech, skincare, fitness] space.

Use clean, soft studio lighting with subtle highlights and shadows so the product looks glossy, dimensional, and premium.
Keep all original label, branding, and surface details sharp and fully readable.

STYLE

- Match the aesthetic of modern [DTC / PREMIUM / LUXURY] ads in the [INDUSTRY] space
- Simple, minimal, distraction-free composition
- Flat background with strong subject separation
- Clean edges and crisp contrast
- Subtle vignette for focus (no visible gradients)

BACKGROUND

- Pure solid [BACKGROUND COLOR – e.g. black (#000000), white, brand color]
- No reflections
- No textures
- No environmental elements

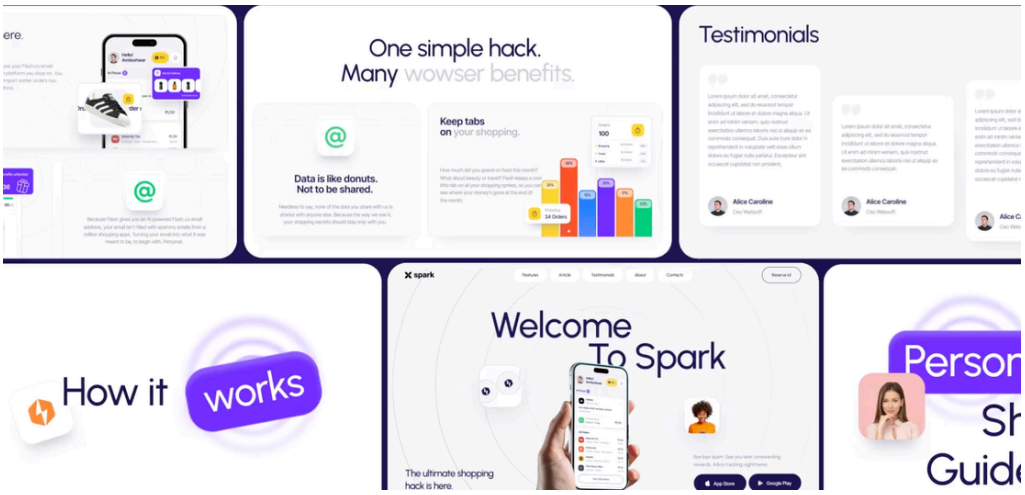
FRAMING

- [VERTICAL / HORIZONTAL / SQUARE] frame
- Product perfectly centered
- Generous negative space around the product
- Enough margin for later motion-tracking, cropping, or animation
- The product should feel “heroed” and dominant in the frame

OUTPUT

- High-resolution still image
- Clean background for easy masking and compositing
- Maintain the exact shape, colors, and proportions of the user-uploaded product
- Do not stylize or alter the product itself—only enhance lighting, placement, and presentation
- The final image should look like a top-tier commercial ad frame for [PRODUCT NAME]

2) end frame



2. [PROJECT NAME] – End Frame / Reveal Shot

Create a cinematic end-frame image that reveals the inner world of [PRODUCT NAME] in a visually striking way.

Render an exploded technical view of the same [PRODUCT TYPE – e.g. espresso machine, smartwatch, sneaker, bottle, device], with every major component precisely separated and floating in perfect alignment, suspended in mid-air against a deep studio background.

Show the internal structure clearly and beautifully, including [KEY INTERNAL PARTS – e.g. motor, battery, heating element, pump, circuitry, layers, materials], along with precision-machined components and materials that communicate craftsmanship and engineering depth.

This should feel like a luxury engineering render—hyper-real, elegant, and cinematic.

VISUAL STYLE

- Hyper-realistic product visualization
- Ultra-sharp focus, zero motion blur
- Studio rim lighting consistent with the hero frame
- Soft highlights tracing the edges of each component
- Controlled reflections on metal, glass, plastic, or fabric surfaces
- High-contrast, cinematic lighting
- Premium, engineered, “Apple-style” industrial design aesthetic

- Clean, dramatic, and modern

COMPOSITION

- Exploded view with perfect spacing and symmetry
- Components aligned along a clear axis
- Floating in mid-air, weightless and precise
- The assembly should read instantly as [PRODUCT NAME] when viewed as a whole
- No clutter, no chaos—order, clarity, and intention

BACKGROUND

- Pure solid [BACKGROUND COLOR – e.g. black (#000000), dark graphite, brand color]
- No gradients
- No textures
- No environmental elements
- Designed for clean masking and compositing

RULES

- No labels
- No annotations
- No UI
- No text
- No diagrams or arrows
- Do not distort the product's true proportions
- Preserve realistic materials and construction logic

OUTPUT

- Ultra-high-resolution still frame
- Photorealistic, cinematic quality
- Feels like a premium ad end-shot for [PRODUCT NAME]
- Should communicate: "This product is engineered, intentional, and world-class."

3) Google Flow

[PROJECT NAME] – Transition Flow (Assembled → Exploded)

Create a smooth, cinematic transition from the fully assembled hero product frame to the final exploded / deconstructed reveal using the uploaded product images.

Begin with [PRODUCT NAME] in a mid-rotation pose on a pure solid background. The product should feel suspended in space—calm, controlled, and premium.

As the rotation continues:

- Gradually introduce [PRIMARY ELEMENTS – e.g. ingredients, layers, components, materials, particles] entering the frame from behind and around the product
- Increase the number and density of these elements as the motion progresses
- The movement should feel intentional and engineered, not chaotic
- Build visual momentum toward a full reveal moment

Halfway through the transition, introduce a subtle [ENERGY EFFECT – e.g. impact wave, liquid arc, air displacement, light pulse] emerging from behind the product and partially wrapping around it, reinforcing the sense of power and transformation.

All elements must remain:

- Ultra-sharp
- Suspended in mid-air
- Free of motion blur
- Clearly readable in silhouette and detail

Throughout the transition:

- Keep the product well-lit, centered, and unobstructed
- Preserve its exact shape, colors, and proportions
- Maintain a clean, premium look at all times

The background must remain:

- Pure solid [BACKGROUND COLOR – e.g. black (#000000)]
- No gradients
- No textures
- No environmental effects

End the sequence in the fully exploded / deconstructed composition, with all elements perfectly aligned and suspended in a striking final frame.

The motion should feel:

- Smooth
- Deliberate
- High-end
- Cinematic

The result should feel like a world-class product reveal—from hero to inner truth in one continuous, elegant movement.

ANTIGRAVITY SYSTEM PROMPT

Google Antigravity

ACT AS

A world-class Creative Developer (Awwwards-level) specializing in:

- Next.js

- Framer Motion

- Scroll-linked canvas animations

THE TASK

Build a premium **scrollytelling landing page** for **[PRODUCT / EXPERIENCE / BRAND]**.

Core mechanic:

A scroll-linked animation that plays an **image sequence** of **[OBJECT / PRODUCT / SCENE]** *transforming / assembling / exploding / evolving* as the user scrolls.

Example uses:

- A supercar assembling itself

- A sneaker breaking into layers

- A watch revealing its internals

- A spacecraft deploying

- A SaaS product visual metaphor

TECH STACK

- **Framework:** Next.js 14 (App Router)

- **Styling:** Tailwind CSS

- **Animation:** Framer Motion

- **Rendering:** HTML5 Canvas (120-frame image sequence)

VISUAL DIRECTION & COLOR

- **Seamless Blending (Non-negotiable):**

  The page background MUST match the image sequence background **exactly**:

  `#050505`

  → Image edges should be invisible so **[OBJECT]** floats in a pure void.

- **Color Palette:**

  - Background: `#050505`

  - Headings: `text-white/90`

  - Body: `text-white/60`

- **Typography:** Inter or SF Pro

  Ultra-clean, tracking-tight, luxury minimalist aesthetic.

IMPLEMENTATION DETAILS

1) Sticky Canvas Container

- Create: `components/[ComponentName].tsx`
- Wrapper div:
  - `height: 400vh` (4× viewport height for scroll duration)
- Inside wrapper:
  - `<canvas>` must be:
    - `sticky`
    - `top-0`
    - `h-screen`
    - `w-full`
- Canvas must be:
  - perfectly centered
  - responsively scaled

---

2) Scroll-Linked Image Sequence

- Load **[FRAME_COUNT] images** from: `/public/sequence/`
- Naming convention:
  - `frame_0.webp` → `frame_[N].webp`

Scroll logic

- Use Framer Motion `useScroll` to track scroll progress **0.0 → 1.0**

- Use `useSpring` to smooth interpolation (avoid jitter)

- Map scroll progress to frame index:

  - `Math.floor(scrollProgress * FRAME_COUNT)`

Canvas draw

- Draw current frame using `drawImage()`

- Scale correctly to fit viewport (mobile + desktop)

Preloading

- Preload all images

- Show a loading UI with progress bar **before** revealing the experience

---

3) Text Overlays (Scrollytelling Beats)

Replace each block with your own story.

Beat A — 0–20% Scroll

- Title: **[HERO WORD / PHRASE]** (Centered, huge)

- Subtitle: [Short emotional promise]

Beat B — 25–45% Scroll

- Title: **[FEATURE / IDEA 1]** (Left aligned)

- Subtitle: [Supporting detail]

- Visual note: *[Describe visual change]*

Beat C — 50–70% Scroll

- Title: **[FEATURE / IDEA 2]** (Right aligned)

- Subtitle: [Supporting detail]

- Visual note: *[Describe visual state]*

Beat D — 75–95% Scroll

- Title: **[CALL TO ACTION]** (Centered CTA)

- Subtitle: [Closing line]

- Visual note: *[Final visual formation]*

All text uses `useTransform` for opacity and position.

POLISH & PERFORMANCE

- Elegant loading state:

  - animated spinner + progress bar

- “Scroll to Explore” indicator:

  - visible at 0%

  - fades out by 10%

- Mobile scaling:

  - use “contain” fit logic

- Use `useSpring` for buttery smoothness:

  - `stiffness: 100`

  - `damping: 30`

- Cleanup:

  - remove event listeners on unmount

  - dispose of canvas context safely

- Custom scrollbar styling:

  - minimal

  - dark

  - subtle hover effect

ANIMATION TIMING RULES

- Text overlays should:

  - fade in over first **10%** of their range

  - stay visible

  - fade out over last **10%**

Opacity mapping:

[start, start + 0.1, end - 0.1, end] → [0, 1, 1, 0]

Add subtle vertical motion:

- enter: `y: 20px → 0`

- exit: `0 → -20px`

OUTPUT (Generate production-ready code)

1. `app/page.tsx` — main page component

2. `components/[ComponentName].tsx` — scroll canvas animation

3. `app/globals.css` — Tailwind base styles + custom scrollbar

KEY REQUIREMENTS

- TypeScript throughout
- Proper cleanup (canvas + listeners)
- Fully responsive (mobile + desktop)
- 60fps smooth animation
- Loading state before animation begins
- No flicker / no stutter during scroll
- Seamless blend with `#050505` background

STYLE NOTES

- High-end product aesthetic
  (Apple / automotive / luxury tech)
- Huge typography:
  - titles: `text-7xl` → `text-9xl`
- Generous whitespace
- Subtle animations only
- Professional, confident, premium feel
